

# METEOR TIXO

## UNIVERSAL THICKENER FOR EPOXY AND POLYURETHANE RESINS

### USE

Universal thickener for modifying the viscosity of resins. Used mainly when working on vertical surfaces (plinths, risers, walls) to reduce resin flow. In combination with other fillers (fine quartz sands, talcum powder, flours), it allows to create levelling compounds directly on the construction site.

### DOSING

Depending on the desired viscosity, between 0.4% (orange peel effect) and 2.5% (putty) by weight.

### METHOD OF APPLICATION

Pour into the resin and mix at low speed. Stirring too long or too vigorously can weaken the effect of the thickener.

### CONTAINERS

Plastic bucket 1 kg.
